

How **BACKUP AS A SERVICE** Protects Your Business from Ransomware

Ransomware attacks can disrupt business operations, encrypt critical data, and cause costly downtime. While cybersecurity solutions help prevent attacks, businesses also need a reliable backup and recovery strategy.

Backup as a Service (BaaS) provides a managed approach to protecting business data and preparing for unexpected data loss.

What Is Backup as a Service?

Backup as a Service (BaaS) is a managed backup solution where a service provider handles the backup, monitoring, storage, and recovery of a business's data and systems.

Instead of managing backup infrastructure entirely in-house, businesses can rely on a managed service to keep their data protected and recoverable.

How Does Backup as a Service Help Against Ransomware?

A ransomware attack can affect database, servers, and other systems connected to a business network. A properly designed BaaS solution can help businesses recover by maintaining protected backup copies.

Key benefits include:

Automated backups

Reduce reliance on manual backup processes.

Offsite backup

Keep backup copies separate from the primary IT environment.

Backup monitoring

Identify failed or incomplete backup jobs.

Data recovery

Restore important data and systems when needed.

Managed IT service

Reduce the workload on internal IT teams.

However, having backups is not enough. Businesses should also regularly **test backup recovery** to ensure their data can actually be restored when required.

For businesses in Malaysia, managing backup infrastructure internally can require additional hardware, storage, IT expertise, and ongoing maintenance.

Backup as a Service in Malaysia provides a more manageable approach by allowing businesses to outsource backup management to an experienced IT service provider.

It can be particularly useful for organisations that want to improve data protection without adding significant workload to their internal IT team.

AlphaCare Backup as a Service

AlphaCare Backup as a Service provides businesses with a managed approach to protecting critical data and improving backup and recovery readiness.

With professional backup management and monitoring, businesses can reduce the risk associated with data loss, ransomware, hardware failure, and accidental deletion.

Don't wait until a data loss incident happens.

Talk to AlphaCare today to find the right Backup as a Service solution for your business.
